

Risk Mitigation Case Brief

Prepared by:

Case X: IBM

CHOOSE 3 CASES (A, B, C, or D) AND PREPARE A BRIEF USING THE FOLLOWING AS AN EXAMPLE. REPLACE THESE INSTRUCTIONS AND THE EXAMPLE BRIEF WITH YOUR THREE BRIEFS. REMOVE THE HIGHLIGHTING.

IBM is a large, well-known technology company. The case study identifies a specific vulnerability it faces as the wide range of cybersecurity threats, including data breaches and advanced persistent threats. The mitigation that IBM has chosen to face this problem are advanced strategies like advanced threat intelligence, employee training and awareness, and an incident response plan. This approach is proactive because the company is trying to "identify potential threats before they materialize." If IBM were to have chosen risk avoidance as the risk management strategy, they would not be providing many of the software and hardware products they sell and probably none of the cybersecurity services. The impact of this decision would mean that the company would be a much smaller company and not be as well recognized as it is.

Case A:microsoft

Microsoft is a big tech company that makes most of its money from being a DOS. This case shows the specific vulnerability being that due to Microsoft having more people working at home that opens the network to more cyber attacks so they adopted the zero trust architecture to combat it. Which was a reactive response due to never foreseeing everybody working at home due to covid. Which worked but if they had picked acceptance then the Microsoft network would be in shambles from so many point of access through vulnerabilities.

Case D:salesforce

Sales force is a revolutionary software company. Their problem with vulnerability is they are the first company to be 100% cloud based which is revolutionary but creates new problems in data privacy and protection. Their solution to this is encrypting their data and security assessment. Which shows salesforce is proactive with their cyber security because they put these safe guards in place before anything happened. If they picked a different avoidance like transfer and make their company not cloud based then it would be way more secure.

Case C: JP Morgan chase

JP Morgan Chase is one of the most targeted companies by cyber criminals. In 2014 they had a massive data breach. Their solution was increasing their budget and implementing an advanced security system. Which was reactive because it happened after the 2014 data breach. If they took a different approach, like acceptance then JP Morgan case would not be thing like it is anymore.
